

Prompt:

Write me a C program that picks a secret number between 1 and 10. The user gets up to 3 tries to guess the number.

Requirements:

- Use a fixed secret number (for example, 7).
- Use printf to prompt the user and scanf to read their guess.
- Use a while or for loop to let the user guess up to 3 times.
- Use if-else statements to check if the guess is too high, too low, or correct.
- Stop the loop immediately if the user guesses the correct number.
- Print a final win or lose message.

Analysis:

The 2 AIs I used were chatgpt pro through the website and Claude code pro which I have downloaded onto my computer. As far as correctness goes Claude made the more correct program. Chatgpt does not have the number of attempts like Claude has. They both wrote about the same amount of code and both used for loops. But Chatgpt does use 1 less variable, the trade off being it does not keep track of your attempts. Chatgpt does also have 5 comments versus Claudes 2. Claude has a little more going on in its code so it is concerning for maintainability that it only has 2 comments. Overall I chose Claude because of correctness and the only thing I need to change is adding more detailed comments. To fix claudes code I copied and pasted the commenting requirements from the rubric along with my code in claude code.
